

CSCI 362 Software Engineering
Deliverable 1

We have been looking into the Miradi source code and it is very complicated. We tried to select a few files to run it, but it seems like the basic Miradi package is very large. We were not able to get it to run. We tried to import a testing file, but we could get it to build, we got error messages saying that we had missing files. We tried adding the missing files, but the project was not recognizing files we imported. The project was getting too large. We are unsure of where to start.
